The bridge is located on South Professor Street, just north of Morgan Street. Rows of large rock-faced limestone blocks comprise the support wall on the underside of the bridge beneath Professor Street; a few flat limestone slabs extend along the banks of Plum Creek both east and west of the bridge, providing a slight retaining wall, though covered with vegetation. The stone walls are topped and connected by a layer of modern concrete, just below the surface which includes a road paved with asphalt flanked by sidewalks and strips of grass. A modern metal railing, held up by both metal and wood posts, lines the sidewalks on both the east and west sides of the bridge, which is about 35 feet wide across the road and 25 feet across the creek.

The current South Professor St. bridge was completed in October of 1887. It was built to replace an earlier bridge that was destroyed in the Oberlin flood of that year. The new bridge featured iron girders and trusses and wooden joists and floor, and was wide enough not only for the road but also for two eight-foot sidewalks.

The bridge is located on a residential street, with a small grassy expanse leading up to a bed and breakfast and a public path that runs along the creek to the west.
